

Jungus Professional Test CN v1.0 Public Record

1. Identification

- Work title: Jungus Professional Test CN
- Chinese title: 荣格斯专业版认知功能测试
- Version: v1.0 public record
- Language: Simplified Chinese
- Public record date: 2026-06-26
- Publisher / author: Jungus 荣格斯团队
- Website: <https://www.jungus.cn>

This document is a public priority and citation record. The Chinese item text may be published separately as `Jungus_Professional_Test_CN_v1.0_items.md` / `Jungus_Professional_Test_CN_v1.0_items.pdf`. This record does not publish item-to-dimension mappings, scoring weights, reverse-keying rules, backend code, prompt templates, or report-generation logic.

2. Purpose

The Jungus Professional Test is designed to measure fine-grained differences within traditional 16-type personality categories. It is based on a second-generation cognitive function model developed by the Jungus team.

The model keeps the classical MBTI and Jungian function vocabulary as a reference point, but extends it by introducing two additional preference dimensions:

- Object-Background preference for perceiving functions.
- Analysis-Holism preference for judging functions.

These dimensions produce 16 Jungus cognitive functions and 64 personality archetypes.

3. Theoretical Structure

3.1 Object-Background Preference

Object-Background preference describes whether a person tends to perceive the world through relatively independent focal objects or through the surrounding field, context, atmosphere, and background relationships.

This preference applies to perceiving functions and produces:

- Se-O, Se-B
- Si-O, Si-B
- Ne-O, Ne-B
- Ni-O, Ni-B

3.2 Analysis-Holism Preference

Analysis-Holism preference describes whether a person tends to make judgments from abstract principles, formal structures, and independent standards, or from situations, relationships, context, and adaptive balance.

This preference applies to judging functions and produces:

- Te-A, Te-H
- Ti-A, Ti-H
- Fe-A, Fe-H
- Fi-A, Fi-H

3.3 Sixty-Four Archetypes

Combining the classical 16-type framework with the Object-Background and Analysis-Holism preferences yields 64 personality archetypes.

For example, a traditional INTJ profile may split into multiple archetypal forms depending on how Ni and Te are expressed under the Jungus model.

4. Assessment Structure

The Chinese professional test contains a structured item bank and scoring system designed for the Jungus 16-function and 64-archetype model.

The public record discloses high-level structural information and may include the Chinese item text:

- The assessment is in Simplified Chinese.
- The assessment targets cognitive function preferences and type-level archetypes.
- Items are designed to distinguish both traditional cognitive functions and Jungus-specific sub-function variants.
- Results include function-level interpretation and type-level interpretation.
- AI-assisted interpretation may be used in the deployed product, but operational prompts and generation rules are not disclosed in this public record.

5. Limited Non-Operational Sample Items

The following sample items demonstrate style and general measurement intent. The complete Chinese item text may be included in `Jungus_Professional_Test_CN_v1.0_items.md` / `Jungus_Professional_Test_CN_v1.0_items.pdf`, but scoring mappings and algorithmic details are not disclosed.

1. 当你进入一个陌生环境时，你更容易先注意到突出的具体对象，还是整体气氛和背景关系？
2. 当你做重要决定时，你更倾向于依据清晰原则推进，还是根据具体情境灵活调整？
3. 面对复杂的人际关系时，你更重视亲密对象之间的情感互惠，还是群体关系中的整体协调？
4. 当你解释一个现象时，你更喜欢从基础定义和原则出发，还是从大量具体观察中归纳出最可能的解释？

These examples are non-operational and are not sufficient to reconstruct the assessment.

6. Protected Materials Not Disclosed

The following materials are not published in this repository:

- item-to-dimension mappings;
- scoring weights;
- reverse-keying rules;
- normalization logic;
- backend scoring implementation;
- AI interpretation prompt templates;
- report-generation rules;
- user data;
- private database materials;
- internal research notes.

These materials remain protected as copyrighted works, software, confidential know-how, and trade-secret materials of the Jungus team.

7. Checksums

The repository includes `checksums.sha256`, which records SHA-256 hashes of selected source/private files preserved by the authors.

These hashes serve as evidence that the corresponding internal files existed in a fixed form at the time of this public record, without revealing the files themselves.

8. Rights Notice
